

Hyderabad-first · built to go national

September 2026

# The big idea

Hyderabad's PG network is an **unbuilt hotel network**  
that already exists —  
and nobody can see it.

One dataset, two faces: **tenants** search verified PGs by commute and budget; **owners** run the whole business and get the tenants.

# The problem — for tenants

- **No live availability.** Listings tell you a PG *exists*, not whether a bed is free tonight.
- **Commute is unknown.** Proximity is how rent is priced, but no one shows travel time to *your* office or college.
- **Trust is broken.** Fake photos, fake reviews, deposit disputes, curfews.
- **Budget guessing.** No way to filter by *your* number across rooms and localities.

## Quantified

446 airport-touting cases a year; travel agents admit “hardly anyone to give information when someone asks.”

# The problem — for owners

- **Fragmented and informal.** Runs on registers and WhatsApp; cash and UPI mixed.
- **Compliance is now mandatory.** Jul 2026 audit of 447 women's hostels: **44%** valid licence, **0%** fire-exit plan, **62%** scored below 40/100.
- **GST confusion.** Owners charge cash and threaten a 12% surcharge they often *don't owe*.
- **Vacancy is their #1 silent cost.** Empty bed = Rs. 0/month, and no demand channel.

# The opportunity is enormous

- **6.6M** beds demanded vs **0.3M** organised — **<5%** penetration
- Market: **Rs. 40 bn** (2025) → **Rs. 206 bn** (2030)
- **447** hostels in one Hyderabad police zone alone
- Regulation (Project Safe Stay) is *forcing* digitisation now

# The solution — two faces, one dataset

## Why it wins

Not a listings site, not an operator — the **operating layer** that produces the live, verified data nobody else has.

# The flywheel

The same verification that protects tenants is what ranks owners higher.

# Tech stack — what we built (front-end prototype)

| Layer    | Choice                    |
|----------|---------------------------|
| Frontend | React 19 + TypeScript     |
| Build    | Vite 7                    |
| UI       | Tailwind CSS v4 + lucide  |
| Routing  | React Router 7            |
| State    | Zustand (persisted)       |
| Maps     | Leaflet + OpenStreetMap   |
| Domain   | GST engine, commute logic |

- Zero backend — runs on localStorage, works offline
- Class-based dark mode, PWA-ready
- Hash routing — hosts anywhere

# Planned production architecture

# Tenant experience

- Search by **locality**, **commute** and **your own budget**
- Live map with price pins (desktop + mobile)
- Per-listing: verified badge, compliance status, reviews, pricing
- **Request a visit** → lands in the owner's inbox

Your office PG

● ----- 2.4 km · ~**7 min** by bike ----- ●

Commute = straight-line distance + time estimates now; real routing (OSRM / Distance Matrix) later.

# Owner experience

- Dashboard: occupancy, rent roll, dues
- Rooms & tenants: bed-level inventory
- Billing with auto-**GST**
- Electricity, food, compliance vault
- **Leads** inbox
- Printable, GST-compliant **receipts**
- Expiry alerts for licence / fire NOC / FSSAI
- Verified badge  $\Rightarrow$  higher ranking

# The GST engine — automatic and correct

- Every receipt prints the correct declaration
- Electricity treated as a pass-through (no GST)
- Turns owner tax anxiety into a **feature**

# Fraud prevention — verify before listing

A 4-step owner onboarding:

- 1 Owner (name, phone)
- 2 Property (address, PIN)
- 3 **Verification** — GSTIN, photos, GPS
- 4 Review → *verification pending*

Production plan:

- OTP (Twilio / MSG91)
- GSTIN lookup (Razorpay / Cleartax)
- GPS × address cross-check
- Admin approve / reject

# What is real vs simulated today

| Feature                            | Prototype       | Production        |
|------------------------------------|-----------------|-------------------|
| Search, filters, map               | Real            | Real              |
| Commute (distance/time)            | Real (estimate) | Real routing      |
| GST engine                         | Real logic      | + GSTIN lookup    |
| Verification capture               | Real UI         | + OTP, KYC, admin |
| Payments / OTP / live availability | Simulated       | Backend           |

# Roadmap

- 1 **Now** — Hyderabad depth: backend (Postgres, auth, UPI), convert owners
- 2 **Then** — Hyderabad coverage: Google Places, ONDC, listings + entity resolution
- 3 **Top 10 cities** — Bengaluru, Pune, Mumbai, Delhi-NCR, Chennai, ...
- 4 **National + ML** — pricing, fraud, recommendations at scale

The moat is the operating layer that produces **verified, live, bed-level** data — the thing every listing site lacks.

# PGease

Find a verified PG near your work. Or fill yours faster.
